

TITLE

SELECT/REFRESH METHOD AND APPARATUS

ABSTRACT OF THE DISCLOSURE

5 A select and refresh system (21) runs on a target (14) and source (12). Users can select specific database element values and parameters for refresh from the source (12) to the target (14). The select and refresh system (21) need not send the entire database because the select and refresh system (21) determines, based on database structure and user input, the portions of data tables to send.
